

Supplementary Fig. 3. Cumulative opioid consumption during the postoperative 48 hours.

The boxplot represents the median (horizontal solid line within the box), lower and upper quartiles (lower and upper edges of the box), and the minimum and maximum (lower and upper whiskers) values. There was no significant difference in opioid consumption between groups ($p=0.627$). Additionally, no significant interaction was found between the groups and the measurement time points ($p=0.371$). CCB20, costoclavicular block (CCB) with 20 mL of 0.75% ropivacaine; CCB40, CCB with 40 mL of 0.375% ropivacaine.
